

How to use the 05552 lock

The included parts:

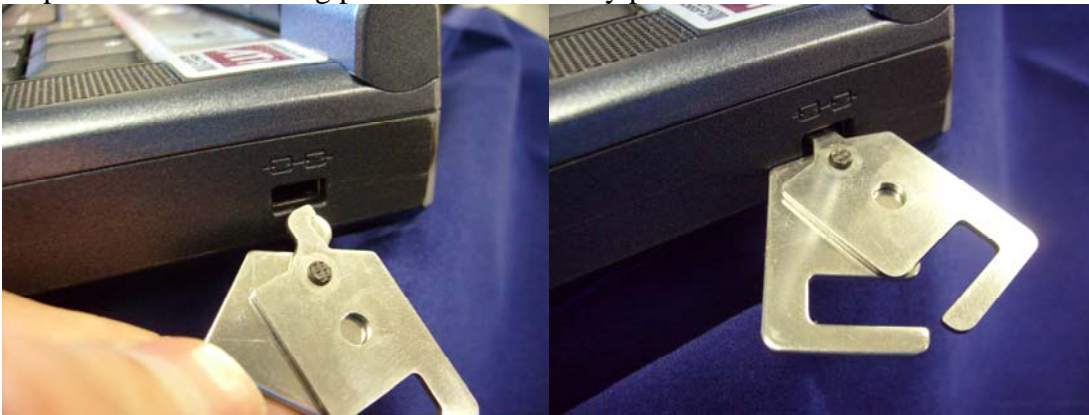

Step one. Unpack your lock and find a sturdy place to secure your system to.

Step two. Locate the security lock port on your computer or device.

Step 3. Insert the locking piece into the security port.

Step 4. Close the locking mechanism and insert the key lock and cable.

How to change the combination:

The default passcode is “000.” If you choose to change this, then you will have to follow these steps:

Step 1. Unlock the lock and turn the bar backwards.

You will have to press the ring closed all the way and press it in. Once it is held firmly closed, then proceed to step 2.

Step 2. Firmly hold the ring closed in the backwards position. Now, you will be able to change the combination to whatever you wish. Once it is changed, pull the ring open.

In this picture, I chose to change the combination to 123.

The combination was successfully changed to 123.
